You

I'm planning on making a new showcase video on my Structured English Programming Language for my Python channel where do Tutorials, Showcases, Tips and Tricks videos and more. How can I make the video engaging for viewers while also keeping somewhat of a serious tone? I want to be able to use sound effects like the vine-boom and other meme effects without undermining the message of the video. Attached are my notes on the project so far, I want to quickly run through the code, show it running and also some of the associated files like the training data CSV for my saved ML model. All the footage will be screen recording or post-edited clips with a voiceover recorded afterwards. How can I make this into one people will remember?

Copilot

That sounds like a brilliant project, Hasan — and a perfect fit for a showcase that blends technical depth with personality. You've got a unique concept with LinguaCode, and the challenge now is to present it in a way that's both **memorable** and **digestible**. Here's a breakdown of how to structure your video to strike that balance between **engaging** and **serious**, while making full use of your voiceover, editing, and meme-worthy sound effects.

🎬 Video Structure: Engaging Yet Informative

1. Hook (0:00–0:30)

- **Start with a bold, punchy statement**:
  "What if you could write code like this… and get Python like this?"
  Then show a quick side-by-side of structured English → Python translation.
- Use a **vine-boom or glitch effect** when revealing the Python output — it adds drama without being silly.
- Flash the LinguaCode logo or name with a subtle animation or sound cue.

2. Concept Overview (0:30–1:30)

- Briefly explain the motivation:
  "I started LinguaCode to make programming more intuitive for beginners — think pseudocode meets AI."
- Mention the modules and what they do, but keep it high-level. Use **animated overlays or pop-up text** to highlight key terms like translation_context, trainModel, etc.
- Use a **serious tone** here, but throw in a light meme sound when transitioning between modules — like a swoosh or pop.

3. Code Walkthrough (1:30–3:30)

- Screen record the IDE and show how the main module works.
- Narrate the options clearly:
  "Option 1 lets you input structured English directly…"
  Then show a quirky example like *"While the number is less than 5"* → *"number < while"* and react with a vine-boom or record-scratch sound.
- Explain the translation matrix and how it's evolving. You can even show a snippet of the dictionary and highlight a few funny or unexpected mappings.
- For the ML model, show the training CSV briefly and explain how it works for exact phrases.
  "It's like teaching a toddler — great with repetition, but throw in a curveball and it panics." (Add a meme sound here for comic relief.)

4. Demo (3:30–5:00)

- Run the program live or show a pre-recorded clip of it translating a few examples.
- Use **split-screen or overlay text** to show input vs output.
- Add subtle sound effects when the translation works well, and meme effects when it misfires — but keep it short and snappy.

5. Challenges & Progress (5:00–6:00)

- Talk about the development timeline:
  "Started in Nov 2023, paused for uni and the AI Apps Challenge, but now it's back."
- Mention the feedback from your last video and how this one improves on it.
- Show a quick timeline graphic or progress bar to visualize the journey.

6. What's Next? (6:00–6:30)

- Tease upcoming features:
  "Next up: a full IDE in C#, smarter AI assistant, and better phrase handling."
- Invite feedback and suggestions from viewers — maybe even structured English phrases they want to see translated.

7. Outro (6:30–7:00)

- End with a call to action:
  "If you want to see code written like plain English, subscribe and stay tuned."
- Flash your channel branding, maybe with a final meme sound or animation — something subtle but fun.

🎧 **Sound Effects: Use With Purpose**

- **Vine-boom**: Use for dramatic reveals or unexpected translation results.
- **Record scratch / Windows error**: Great for highlighting bugs or misfires.
- **Pop / swoosh / whoosh**: Use for transitions between modules or sections.
- **Subtle ambient music**: Keep it low-volume and minimal to maintain a serious tone.

🤓 **Tips for Making It Memorable**

- **Use humor sparingly but strategically** — it makes the technical content more relatable.
- **Show personality in your voiceover** — confident, curious, and slightly cheeky works well.
- **Keep visuals clean and focused** — use zoom-ins, highlights, and overlays to guide attention.
- **Include a few "aha!" moments** — like showing how a phrase gets translated perfectly after training.

If you'd like, I can help you write a sample voiceover script or storyboard for the video. Or even brainstorm some meme-worthy phrases to test in LinguaCode. Want to go that route next?

You

(Now Saturday, Aug 16)
Can you give me the script and break it down into sections like before?

Copilot

Absolutely! Here's a full voiceover script for your LinguaCode showcase video, broken down into clear sections that match the structure we discussed earlier. It blends a serious tone with moments of humor and personality, and leaves room for meme sound effects and visual cues.

🎬 **LinguaCode Showcase Script**

1. Hook (0:00–0:30)

"What if you could write code like this…
'While the number is less than 5'
...and get this?"
'while number < 5:'
[**Vine-boom** sound effect]
"Welcome to LinguaCode — where structured English becomes Python."

2. Concept Overview (0:30–1:30)

"I started this project back in November 2023 with one goal: make programming easier for beginners. Instead of learning syntax, they could just write what they mean — and let AI do the rest."
"After a community poll, I named it LinguaCode — Language meets Code."
"It's grown into a full suite: a Python translator, a C# IDE, an AI assistant, and documentation. But today, we're focusing on the translator."

3. Code Walkthrough (1:30–3:30)

"Let's dive into the modules. The main one gives you four options:"
"Option 1: Input structured English code — multiline."
"Option 2: Input a single command — uses the trained ML model."
"Option 3: Translate from a file."
"Option 4: Exit. Obviously."
[**Pop sound effect**]

“Option 1 uses a translation matrix — basically a big dictionary of common phrases. It’s still a work in progress, so sometimes you get gems like…”
‘number < while’
[**Record scratch**]
“…instead of ‘while number < 5:’. We’re almost there.”
“Option 2 uses a saved ML model trained on a CSV of common phrases. It’s great for exact matches, but throw it a curveball and…”
[**Windows error sound**]
“…yeah, not so great.”
4. Demo (3:30–5:00)
“Let’s run it. I’ll input a few phrases and show you what comes out.”
[Show screen recording of input/output with overlay text]
“Here’s a structured English snippet…”
‘If the score is greater than 90, print “Excellent”’
“…and here’s the Python translation.”
‘if score > 90:\n print("Excellent")’
[**Satisfying swoosh or ding**]
“Now let’s try a single command using the ML model…”
‘Create a function that adds two numbers’
“…and boom.”
‘def add(a, b): return a + b’
[**Vine-boom or applause**]
5. Challenges & Progress (5:00–6:00)
“Development started almost two years ago, but it’s been slow — uni, AI Apps Challenge, and other projects.”
“I made a video last year, but it was too fast-paced and confusing. This time, I’m keeping it clear and focused.”
“The scope has expanded massively — from a few saved snippets to a full translation engine with ML support.”
6. What’s Next? (6:00–6:30)
“Next up: a full IDE in C#, smarter phrase handling, and maybe even voice input.”
“If you’ve got structured English phrases you want to see translated, drop them in the comments.”
7. Outro (6:30–7:00)
“Thanks for watching. If you want to see code written like plain English — and actually work — subscribe and stay tuned.”
[**Final meme sound or subtle animation**]
“This is LinguaCode. Let’s make programming human again.”

Would you like me to help storyboard this visually — like what to show on screen during each section? Or even prep a short teaser version for social media?

You

Ok almost there, however, this phrase is factually inaccurate: It’s grown into a full suite: a Python translator, a C# IDE, an AI assistant, and documentation. But today, we’re focusing on the translator.

The actual thing is that the translator is almost finished now and I'm planning on working on the other things next afterwards. I plan to release the programming language and relevant tools packaged together in 2026 or maybe 2027 depending on how progress goes.
Also mention somewhere that my university friends encouraged me to make my own programming language and so something like this was my idea then (since generic programming languages and ideas have all been done really well before).

Copilot

Perfect — thanks for the clarification! Here's the revised script with those updates woven in naturally. I’ve adjusted the tone to reflect that LinguaCode is still in development, with the translator nearly complete and the rest planned for future release. I also added the origin story about your university friends encouraging you to create your own language, which adds a nice personal touch.

LinguaCode Showcase Script (Updated)

1. Hook (0:00–0:30)

"What if you could write code like this…
'While the number is less than 5'
…and get this?"
'while number < 5:'
[**Vine-boom** sound effect]
"Welcome to LinguaCode — where structured English becomes Python."

2. Concept Overview (0:30–1:30)

"Back in November 2023, I started building LinguaCode with one goal: make programming easier for beginners. Instead of memorizing syntax, they could just write what they mean — and let AI do the rest."
"The idea came from my uni friends, who encouraged me to make my own programming language. Since most general-purpose languages have already been done brilliantly, I wanted to try something different — something human-readable."
"LinguaCode is still in development, but the translator is nearly finished. The plan is to release the full suite — including the language, IDE, AI assistant, and documentation — sometime in 2026 or 2027, depending on how progress goes."

3. Code Walkthrough (1:30–3:30)

"Let's dive into the translator. The main module gives you four options:"
"Option 1: Input structured English code — multiline."
"Option 2: Input a single command — uses the trained ML model."
"Option 3: Translate from a file."
"Option 4: Exit. Obviously."
[**Pop sound effect**]
"Option 1 uses a translation matrix — basically a big dictionary of common phrases. It's still a work in progress, so sometimes you get gems like…"
'number < while'
[**Record scratch**]
"…instead of 'while number < 5:'. We're almost there."
"Option 2 uses a saved ML model trained on a CSV of common phrases. It's great for exact matches, but throw it a curveball and…"
[**Windows error sound**]
"…yeah, not so great."

4. Demo (3:30–5:00)

"Let's run it. I'll input a few phrases and show you what comes out."
[Show screen recording of input/output with overlay text]
"Here's a structured English snippet…"
'If the score is greater than 90, print "Excellent"'
"…and here's the Python translation."
'if score > 90:\n print("Excellent")'
[**Satisfying swoosh or ding**]
"Now let's try a single command using the ML model…"
'Create a function that adds two numbers'
"…and boom."
'def add(a, b): return a + b'
[**Vine-boom or applause**]

5. Challenges & Progress (5:00–6:00)

"Development started almost two years ago, but it's been slow — uni, AI Apps Challenge, and other projects."
"I made a video last year, but it was too fast-paced and confusing. This time, I'm keeping it clear and focused."
"The scope has expanded massively — from a few saved snippets to a full translation engine with ML support. And soon, it'll be part of a complete programming language package."

6. What's Next? (6:00–6:30)

"Next up: building the IDE in C#, smarter phrase handling, and maybe even voice input."
"If you've got structured English phrases you want to see translated, drop them in the comments."

7. Outro (6:30–7:00)

"Thanks for watching. If you want to see code written like plain English — and actually work — subscribe and stay tuned."

[**Final meme sound or subtle animation**]
"This is LinguaCode. Let's make programming human again."

Would you like me to help write a short teaser version for TikTok or Instagram? Or prep a visual storyboard to match this script with screen recordings and animations?

You

(Now Sunday, Aug 17)
I'm also planning a "7 Features I frequently use in Capcut" video for my tech channel where I'm gonna showcase the features and show how the viewers can use them in their vids as well. Currently, I'm unsure what footage to using the editor for the showcase, I'm editing a career mode video at the moment, I can sure some stuff with that but what other generic footage should I use. Below is a list of all the features I use in Capcut, which should I show in the video and how should I structure it? Bear in mind that all footage shown in the video will be screen recordings from capcut and voiceovers from me.

Possible Features List:

- Text presets such as various effects of different colours, "Subscribe" - Gold and Silver (my favourite one), "Thank you for watching" - White text transition down with "Share button" in Black, "Brand Energy Drink" - with White First line text then black Second line text and orange box behind Second line text, "The Moment" - White and black text that comes in from opposite sides, "Best Upcoming Movies 2023" - first line text in Red that comes in from side and Second line text in Silver, etc.
- Popular Text Transitions (To give text more impact) such as Concentrate, TypeWriter, Chroma Type, Slide Up, Trail, Dissolve, Throw Out, Pop Up, Blur Left, etc.
- Some Animated stickers such as Arrows, Circles, etc. and some Like/Subscribe stickers as well as Emoji Stickers that aren't animated
- Blur and Sharpen Edges Effects (Apply to full video clip and intensity can be adjusted)
- Core Transitions such as Mix, Black fade, Shake, Rotate CW, Siding Memories, Left, Woosh, Pull In, etc. Also trying some new ones in that Career Mode vid.
- Text To Speech with Narrator like voices (most used on my Python channel)
- Fade Filter (Black and White) which is mostly used for Flashbacks
- Chroma Key to remove background of green screen clips and similar footage/images
- Key Framing to ensure smooth transitions when parts of the video or overlay images need to move quickly
- Extract Audio usually for clips where the video isn't needed but the audio is
- Crop for images and Freeze for videos (to pause the video for a few seconds while audio still flows or for memes, edits, etc.)
- In-editor voice overs (extremely useful as mostly prefer to record voice afterwards)

Copilot

This is a fantastic idea for your tech channel, Hasan — practical, relatable, and packed with value. Since you're already editing a Career Mode video, you've got a great base to work from. Let's build a structure that showcases your **top 7 CapCut features**, using a mix of **real edits**, **generic footage**, and **voiceover tips** to make it both educational and engaging.

🎬 Video Structure: "7 CapCut Features I Use All the Time"

1. Hook (0:00–0:30)
"If you've ever edited a video and thought 'I wish this looked more pro' — these 7 CapCut features are my go-to tools to make any video pop."
"Whether it's for my Python channel or gaming edits, these tricks save time and make everything look clean."

[Show quick montage: text effects, transitions, blur, stickers — with upbeat music and meme-worthy sound effects.]

🎛️ Feature Breakdown (0:30–5:30)

Here's how to pick your **Top 7** and what footage to use for each:

1. Text Presets & Transitions

☑ **Include**

🎥 Use: Career Mode footage with overlays like "Subscribe," "The Moment," or "Best Upcoming Movies."

🎙️ Voiceover:

"CapCut's text presets are underrated. I use gold and silver for 'Subscribe' — it just pops. And transitions like TypeWriter or Throw Out add impact without extra effort."

2. Core Transitions

☑ **Include**

🎥 Use: Match transitions to scene changes in your Career Mode video — goals, replays, cutaways.

🎙️ Voiceover:

"Mix, Shake, and Woosh are my go-tos. They keep the energy up and make even basic clips feel dynamic."

3. Blur & Sharpen Effects

☑ **Include**

🎥 Use: Generic footage — maybe a slow pan of a stadium or a static image — apply blur/sharpen to show contrast.

🎙️ Voiceover:

"Blur and sharpen edges are great for flashbacks or dramatic moments. Just tweak the intensity and you've got instant mood."

4. Chroma Key

☑ **Include**

🎥 Use: Any green screen clip or meme image — even a Python tutorial overlay.

🎙️ Voiceover:

"Chroma Key is essential. I use it to drop in overlays, memes, or even tutorial clips without the background clutter."

5. Key Framing

☑ **Include**

🎥 Use: Career Mode footage with moving arrows or zoom-ins on players/stats.

🎙️ Voiceover:

"Key framing lets you move elements smoothly — perfect for zooms, pans, or tracking overlays."

6. Text-to-Speech

☑ **Include**

🎥 Use: Python channel footage with TTS narration — show the voice selection and result.

🎙️ Voiceover:

"Sometimes I don't want to record audio live. CapCut's text-to-speech is surprisingly solid — especially the narrator voices."

7. Freeze & Crop

☑ **Include**

🎥 Use: Career Mode clip paused mid-action with meme overlay or dramatic audio.

🎙️ Voiceover:

"Freeze is perfect for memes or dramatic pauses. Crop helps clean up images or focus attention."

🧠 Other Features to Mention Briefly (Optional B-roll or Bonus Section)

- **Animated Stickers**: Use arrows or emojis to highlight parts of the screen.
- **Extract Audio**: Show a clip where you isolate commentary or music.
- **Fade Filter**: Use for flashback scenes or emotional edits.
- **In-editor Voiceover**: Mention how you prefer post-recording and show the voiceover tool briefly.

🎤 Voiceover Tips

- Keep tone friendly and confident — like you're giving advice to a fellow creator.
- Use meme sounds sparingly (vine-boom, pop, swoosh) to emphasize cool moments or transitions.
- Add short reactions like *"This one's a lifesaver"* or *"I use this in almost every video"* to personalize.

📽️ **Footage Suggestions**
If you need **generic footage** beyond Career Mode, try:

- A screen recording of browsing YouTube or editing a thumbnail.
- A simple Python tutorial clip with overlays.
- A meme image or green screen clip for Chroma Key.
- A static image (e.g., stadium, landscape, UI screenshot) for blur/sharpen demo.

Would you like a full voiceover script for this one too? I can write it in the same style as your LinguaCode showcase — punchy, clear, and tailored to your editing style.

You

(Now Thursday, Aug 28)
Ok now based on everything you already know about the structured English Coding Language and the attached word doc of my previous Medium Article, how can I write an article for this, referencing the video and using it as instead of the image before the intro?

Copilot

Great move, Hasan — using your upcoming video as the visual hook before the intro is a smart way to draw readers in and give them immediate context. Based on your previous Medium article's tone and structure, plus everything I know about LinguaCode, here's how you can shape this new piece into something compelling, informative, and personal.

🧠 **Article Structure: "How I'm Building My Own Programming Language — LinguaCode"**
Header
Title:
How I'm Building My Own Programming Language — LinguaCode
Subtitle:
From structured English to Python code, here's how I'm designing a language that makes programming more intuitive.
Author Info:
PythonProgrammer
5–6 min read, [Insert Date]
Visual Embed (Before Intro):
Embed your upcoming **LinguaCode showcase video** here. Use a thumbnail that shows a side-by-side of structured English and translated Python — it'll immediately signal what the article is about.

Introduction
Back in November 2023, I started working on an idea that felt both ambitious and personal: creating my own programming language. Inspired by conversations with university friends and my experience teaching Python, I wanted to build something that made coding feel more natural — something that could translate structured English directly into Python code.
Now, almost two years later, LinguaCode is nearly ready. The translator module is close to completion, and I've just released a showcase video walking through how it works.

Why I Wanted to Build a Language
Most programming languages already do a great job — Python, JavaScript, C#, you name it. But I kept thinking: what if beginners could skip the syntax and just write what they mean?
My uni friends encouraged me to try building my own language, and that's when LinguaCode was born. The idea was simple: write structured English, and let AI handle the translation.

How LinguaCode Works
The core of LinguaCode is a Python-based translator. It currently supports three input modes:

- *Multiline structured English input*
- *Single command translation using a trained ML model*
- *File-based translation*

The multiline input uses a translation matrix — a dictionary of common phrases and syntax rules. It's still a work in progress, but it's already producing solid results. The ML model, trained on a CSV of common phrases, handles exact matches well but struggles with variation — something I plan to improve.

Challenges and Progress
Development started in late 2023 but moved slowly due to university, the AI Apps Challenge, and other projects. I released an early video in March 2024, but it was too fast-paced and didn't land well with viewers. This new showcase video is clearer, more structured, and walks through the translator in real time — including some of the quirks and unexpected outputs.

What's Next for LinguaCode
The translator is just the beginning. I'm planning to build a full IDE in C#, an AI assistant, and comprehensive documentation. The full suite will be packaged and released in 2026 or 2027, depending on how development goes.
I'm also exploring smarter phrase handling, voice input, and better ML training for more flexible translations.

Lessons Learned
Building LinguaCode has taught me a lot — not just about AI and syntax, but about patience, scope creep, and the importance of user feedback. It's been a journey of trial, error, and iteration.
Most importantly, it reminded me why I love making tech accessible and fun — whether through tutorials, edits, or creative tools.

Call to Action
Check out the video above to see LinguaCode in action. If you've got structured English phrases you'd like to see translated, drop them in the comments — I'm always looking for new test cases.
And if you're a developer thinking about building your own language or tool, go for it. The process is messy, but the payoff is real.

Would you like me to help you write the full article draft in your Medium voice, or prep a teaser paragraph for social media to promote it once it's live?

You

Ok based on this previous YouTube community post, how can I make one for this article this is the link currently: "https://medium.com/p/0df053d1d8a6"

Previous Post:
I just wrote a new Medium article/story on my upcoming Android Game, Flying Football.
Check it out here: https://medium.com/@pythonprogramsha/...
I'll put the link to download the game in the comments when it comes out, so stay tuned!
Like and Subscribe, Share this post as well.

Copilot

Here's a YouTube Community post draft tailored for your new Medium article on LinguaCode. It keeps the tone consistent with your previous post but adds a bit more intrigue and polish to match the depth of this project:

🚀 **I just dropped a new Medium article on my custom programming language — LinguaCode!**
It's a structured English-to-Python translator I've been building since 2023, and it's finally coming together. In the article, I break down how it works, why I started it, and what's coming next (IDE, AI assistant, full release in 2026/27 👀).
📽️ I've also included my latest showcase video so you can see it in action.
Check it out here: https://medium.com/p/0df053d1d8a6
Drop a comment with phrases you want to see translated, and let me know what you think!
Like, Subscribe, and Share this post if you're into tech, coding, or just cool ideas 🔥

Want a shorter version for Instagram or a pinned comment too? I can whip that up next.

You

(Now Wednesday, Sep 3)
How can I write an engaging and informative description for the 7 Features I frequently use in Capcut vid then?

Copilot

Here's a polished, engaging, and informative YouTube description tailored for your **"7 CapCut Features I Frequently Use"** video. It's designed to hook viewers, explain the value of the video, and encourage interaction — all while reflecting your tech-savvy, creator-focused tone.

🎬 YouTube Description (Full Version)

Want to level up your video edits in CapCut?
In this video, I'm breaking down the **7 features I use all the time** — whether I'm editing Python tutorials, gaming content, or creative shorts. These tools save time, boost quality, and make your videos stand out.

📌 **What's inside:**
– My favorite **text presets** (including gold/silver "Subscribe" and cinematic titles)
– Powerful **text transitions** like TypeWriter, Throw Out, and Chroma Type
– **Core transitions** that add energy: Shake, Mix, Woosh, and more
– How I use **blur/sharpen effects** for flashbacks and dramatic edits
– **Chroma Key** for green screen overlays and clean visuals
– **Key framing** for smooth motion and dynamic overlays
– The underrated magic of **Freeze**, **Crop**, and **Text-to-Speech**

🎥 All footage is edited directly in CapCut, with screen recordings and voiceover tips so you can follow along and apply these tricks to your own videos.

💬 Got a favorite CapCut feature I didn't mention? Drop it in the comments — I'm always experimenting with new tools.

🔔 Like, Subscribe, and Share if you found this helpful. More editing tips, tech tutorials, and creative showcases coming soon!

🎀 Optional Short Version (for pinned comment or Instagram caption)

7 CapCut features I use constantly — and how you can too.
From text presets to transitions, blur effects to key framing — this video walks through my go-to tools for clean, pro-level edits.
🎥 Watch now: [link]
💬 Comment your favorite CapCut trick!

Want help writing the pinned comment or title next? Or a thumbnail caption that pops?
