You

How can I reply to this email in a polite and professional manner:

Sorry for the delay in getting back to you.
I like the proposal below from James.
In terms of goals, I have spoken with the Team manager in the quality assurance team, and we have put together the following:
Support for pulling together the themes of strengths and learning from the monthly audits that take place
Support in identifying the audits that do not have the detail to generate clear themes of strengths and learning
Help streamline/update the audit/supervision database, as currently every moderation must be manually entered into the system and its quite time consuming. (not sure if there is a more efficient way). Support us with thinking about implementing more intuitive systems to record moderation.
These may be a little broad for the project, so happy for them to be amended.
I am afraid I cannot meet this afternoon Hasan and I am struggling a bit tomorrow. Are we ok to confirm anything further over email to ensure that you have what you need for Monday? We can then look at a time next week?
Many thanks,
Anna

I want to say that it's fine, I'm meeting with my professor this afternoon and we can do another meeting next week to discuss the operation and organisational side of things. I believe everything is fine in terms of finalising the project before Monday and I'll do my best to sort out that with my professor today. If there's anything else I'll email but don't envision there will be.

Copilot

Here's a polished and professional reply you could send:

Hi Anna,
Thank you for getting back to us, and no worries at all about the timing.
That all sounds great — I'm meeting with my professor this afternoon and will aim to finalise everything needed for Monday. I believe we're in a good place with the project, and if anything further comes up, I'll be sure to follow up via email (though I don't anticipate any major issues).
Happy to arrange a meeting next week to go over the operational and organisational aspects in more detail — just let me know what works best for you.
Best regards,
Hasan

Would you like to add a note of appreciation for the goals they've outlined, or suggest any edits to them?

You

I've got access to this SharePoint list that exists currently (see attached image - NOW EXPIRED) and I'm trying to replicate it for testing purposes in a different SharePoint environment. However, in the new version that I've made, I can't find the ID column. Judging by the edit options this should be a default column and I shouldn't need to add it separately.

Copilot

You're absolutely right, Hasan — the **ID column is a default system-generated field** in every SharePoint list. It's a read-only integer that uniquely identifies each item, and it's always present behind the scenes, even if it's not visible in the current view.
Here's what might be happening and how to fix it:

🛠 Why You Might Not See the ID Column

- **Not included in the current view**: The ID column may simply be hidden from the view you're using.
- **Custom list template or migrated list**: If the list was created using a non-standard method (e.g. via PowerApps, migration tools, or a Teams-integrated site), the default view might not include the ID column.

- **Renamed or replaced**: In rare cases, someone may have renamed the ID column or created a custom field that mimics it.

☑ **How to Make the ID Column Visible**

1. **Modify the current view**:
   - Go to the list.
   - Click on the **View options** (usually a dropdown near the top right).
   - Select **Edit current view**.
   - Scroll through the list of columns and **check the box for "ID"**.
   - Save the view.
2. **Use the column settings menu** (like in your screenshot):
   - Click the dropdown on any column header.
   - Choose **Show/hide columns**.
   - Look for **ID** in the list and toggle it on.
3. **Create a new view**:
   - If the current view is locked or restricted, create a new personal view and include the ID column.

If none of these work, it's possible the list was created in a way that bypassed standard SharePoint behavior. In that case, let me know how the list was created (e.g. via PowerApps, imported Excel, etc.) and I'll help troubleshoot further.
Would you like help scripting a test list with the same structure and visible ID column using PowerShell or PnP?

You

Ok I found it, it was just hidden in the view I was using.

Copilot

Nice one, Hasan — glad that was a quick fix! SharePoint loves to play hide-and-seek with its default columns. Now that you've got the ID visible, replicating the structure should be much smoother.

If you're planning to test workflows or automation against this list, having the ID exposed can be super handy for referencing items precisely. Let me know if you want help setting up conditional formatting, Power Automate flows, or anything else to mirror the original environment more closely.
